* NOTE: This is a 'working draft' sequence. It currently
* consists of 38 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
New nucleic acid encoding U4 haematopoietin receptor superfamily PT chain - potentially useful, e.g. for modulating cell proliferation PT or immune response, for treating cancer and auto:immune disease PS Claim 1; Pages 25-26; 38pp; English.

CC This is the nucleotide sequence encoding the murine U4 protein from CC the haematopoietin receptor superfamily used in the method of the CC invention for the modulation of cell proliferation, or the immune CC response. Transformed mammalian cells are used to produce recombinant CC U4 protein. The U4 protein is used to screen for specific binding CC agents, raise antibodies. It is also used as reagents for assays and CC as tissue markers for isolation of cognate ligands and receptors, and CC cell differentiation, and the immune system (e.g. for treating immune CC deficiency, inherited or the result of infection, autoimmune diseases, CC cancer, and allergy).

for modulating proliferation, differentiation and survival of cells, e.g. neuronal cells
Claim 4; Page 77-81; 182pp; English.
The haempoletin receptor (HR) NR6.1 is a form of the novel HR NR6.
Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening.

Adams RL, FOSTET DC, Gilbert T
LOK S, Presnell SR, Whitmore T
WPI; 99-034662/03. New mammalian cytokinin-like receptor Zcytor5 - useful for, e.g. down-regulating Zcytor5 natural ligands or detecting cardiotrophin-l in blood Disclosure; Page 72-75; 55pp; English. The present sequence encodes a protein designated Zcytor5, which is V70896 standard; cDNA; 1724 BP.

Y70896;

17-MAR-1999 (first entry)

CDNA encoding rat Zcytor5.

Zcytor5; cytokinin-like receptor; down-regulation; growth maintenance factor; thyroid; heart; skeletal muscle; cardicac pathology; heart enlargement; Zcytor5 ligand; ss.

Rattus sp. Location/Qualifiers 159. 1436 /*tag= a /product= Zcytor5 TE; Jelmberg Lehner cardiotrophin-1;

Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and therapeutically to modify Zcytor5 ligand effects.

Pr Example 8; Page 99-100; 182pp; English.

CC NR6 is a novel haemopoletin receptor (HR). Interaction between the novel CC and a ligand facilitates proliferation, differentiation and survival CC of a wide variety of cells. The HR and it's derivatives can be used for CC modulating the activity of the receptors e.g. to regulate development, CC maintenance or regeneration in an array of different cells and tissues in CC vitro and in vivo. They can be present in therapeutics used for vitro and in vivo. They can be present in therapeutics used for CC modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers CC or predisposition to cancers, or for drug screening.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence encodes a protein designated Zcytor5, which is C a cytokinin-like receptor. Soluble Zcytor5 may be administered to C down-regulate the effects of a growth and/or maintenance factor in C thyroid, heart, and skeletal muscle for example to lessen the effect C of cardiotrophin-1 on cardiac pathologies, so preventing heart C enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the C comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the Tarapeutically to modify Zcytor5 ligand effects.

The present sequence encodes an allelic variant of protein design Zcytor5, which is a cytokinin-like receptor. Soluble Zcytor5 may administered to down-regulate the effects of a growth and/or mainfactor in thyroid, heart, and skeletal muscle for example to les effect of cardiotrophin-1 on cardiac pathologies, so preventing enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the country and to discover other possible Zcytor5 ligands. A probe

Proceeding U4 haematopoietin receptor superfamily procedure and auto:immune disease procedure response, for treating cancer and auto:immune disease procedure 1; Page 28; 38pp; English.

CC This is the nucleotide sequence encoding the human U4 protein from the haematopoietin receptor superfamily, used in the method of the convention for the modulation of cell proliferation, or the immune convention for the U4 protein is used to screen for specific binding agents, raise antibodies. It is also used as reagents for assays and cas tissue markers for isolation of coll grants and receptors, and coll differentiation, and the immune system (e.g. for treating immune coll differentiation, and the immune system (e.g. for treating immune coll differentiation, and the immune system (e.g. for treating immune coll coll differentiation and the immune system (e.g. for treating immune coll coll differentiation).

Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening. Sequence 1391 BP; 281 A; 459 C; 417 G; 234 T;

NR6 is a novel Haemopoietin receptor (HR). Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening. Sequence 834 BP; 167 A; 274 C; 225 G; 168 T;

Disclosure; Page 101; 182pp; English.
NR6 is a novel haemopoletin receptor (HR). Interaction between the novel had a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The

Nucleotide sequence for murine NR6 containing additional 5N sequence.
Nucleotide sequence for murine NR6 containing additional 5N sequence.
Haemopoietin receptor; cell proliferation; cell differentiation; cancell survival; therapeutic; neuronal proliferation; drug screening; seell survival;
                                                                                                                                                                                                                                            Claim 9; Fig 3; 182pp; English.

The NR6 protein is a novel Haemopoletin receptor (HR). Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                6510
                                             The NR6 gene encodes a novel Haemopoietin receptor (HR). Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's products can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           02-ocr-1998 (first entry)

Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the anti-idiotypic antibody could be used to purify Zcytor5 and therapeutically to modify Zcytor5 ligand effects.

The haemopoletin receptor (HR) NR6.2 is a form of the novel HR NR6. Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening. Sequence 1673 BP; 344 A; 550 C; 474 G; 305 T;
